productinformation

tesa® 60150

Adhesion Promoter

tesa® Adhesion Promoter is used to improve the adhesion of tesa® ACX^{plus} tapes on different substrates, including PP/ EPDM, zinc and steel. Due to the multitude of available lacquers and surface formulation in the marketplace we recommend to test our Adhesion Promoter prior to usage.

tesa® Adhesion Promoter 60150 is UV traceable, because of UV pigments contained in the solution.

Main Application

Recommended for various plastics, powder coated surfaces, PP-EPDM, zinc and steel.

Used to enhance the bonding strength and to reach higher peel adhesion values with our ACX^{plus} tapes.

Technical Data

Color	light-yellow	•	Viscosity	15 mPa s
Consistency	liquid	•	Density	$0.81\mathrm{g/cm^3}$
Solids	7 %	•	Spreading rate ca.	15 m²/l

Additional Information

The bonding surface should be free of dust, grease, oil, moisture and other contaminants before using tesa® Adhesion Promoter 60150.

Clean the substrate with a lint free cloth and appropriate solvents, such as Ethanol or Isopropanol.

Then apply tesa® Adhesion Promoter 60150 thinly to the bonding surface, making sure that the entire surface is coated. The Adhesion Promoter can be applied with a lint free clothor brush, application pen or felt applicator.

Wait 30 seconds to 5 minutes to give the solvents time to evaporate.

Keep the prepared surface free from contaminants prior to applying tesa® ACX^{plus} tape.

Open time for bonding are several hours/days.

Shelf life are 12 month when stored in the original container at room temperature.

For all further information kindly refer to the respective material safety data sheet (MSDS).
