

tesa® ACX^{plus} for exterior applications

Our attachment part mounting solutions for the automotive industry

Attachment parts like emblems, body side moldings, and roof ditch trims need to be securely mounted to exterior car body surfaces, and the bond has to withstand all external influences throughout the vehicle's lifetime.

Body side molding

Brake light

Acrylic foam tapes for constructive bonding

Attachment part mounting with tesa® ACX^{plus} for the automotive industry

Constructive bonding of attachment parts to car bodies can be very challenging as traditional mechanical fasteners like rivets, welds, and screws may not be suitable for dissimilar materials such as glass, metal, and plastics. Adhesive tapes permanently and gently join materials without causing damage.

tesa® ACX^{plus} is a category of double-sided tapes for constructive bonding and is our highest performing product line. tesa® ACX^{plus} was especially developed for applications in the automotive industry to securely bond exterior attachment parts to the car body.

Features and benefits of using tesa® ACX^{plus}

The tesa® ACX^{plus} tapes securely mount attachment parts to the car body and at the same time provide reliable sealing and vibration damping. The unique tapes also compensate for thermal expansion and ensure excellent stress dissipation. Their high level of adaptability allows perfect attachment to the car body's curves and corners.

Bonding power

tesa[®] ACX^{plus} creates a powerful bond even between materials with different surface characteristics, such as automotive attachment parts and clear coats. Our product performance characteristics ensure:

- Reliable bond on clear coat and other vehicle parts even after short dwelling time
- Securing of the parts' edges against lifting
- Very high reliability throughout the vehicle's lifetime
- Design flexibility with limited bonding area

Stress dissipation

During the lifetime of a vehicle, static and dynamic stresses act upon the constructive bond between the car body and the attachment part. These can be caused by different thermal elongation of the respective substrates. Due to the viscoelastic behavior of tesa® ACX^{plus}, the stresses can be optimally dissipated, and a secure bond is assured even during extreme temperature changes.

Temperature and weather resistance

The reliable constructive bonds of tesa® ACX^{plus} are resistant to extreme temperatures and temperature changes, different weather conditions, UV radiation, and also chemical influences.

Deep black color

When mounting automotive attachment parts with self-adhesive tapes, the tape will, at best, not be visible after the part has been attached to the car body. This enhances the overall appearance and, therefore, customer satisfaction. The deep black color of tesa® ACX^{plus} Black Line 78XX series ensures minimum visibility between the attachment part and the car body, thus contributing to an appealing car design.

Unique conformability

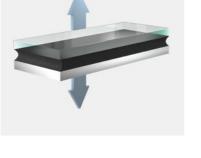

Due to the high conformability, tesa[®] ACX^{plus} is applicable in curves and corners without lifting of the liner. In addition, minor surface irregularities of the parts bonded together can be compensated for, so that a maximum adhesion surface is achieved for a long-lasting bond.

Water sealing

tesa[®] ACX^{plus} creates a permanent sealing that is impermeable to water and other solvents such as washer fluids. This ensures an excellent humidity sealing and prevents corrosion throughout the lifetime of the vehicle.

Noise prevention

The strong, closed-cell foam construction of tesa® ACX^{plus} combined with its high bonding power significantly dampens vibrations and reduces unwanted sounds.
